Protector Marmo

Technical data sheet
n° 560
Rev. 22/04/2015

Category:

- natural stones protectives

Applications:

- It waterproofs all stones, even those with low absorbency and with a glossy finish

Strengths:

- Very fast drying
- Works even on shiny surfaces
- Suitable for indoors and outdoors

Yield: The quantity of product required is between 100 and 300 g/m² depending on the porosity of the material to be treated and the desired penetration depth.

Applications

Invisible protective specially formulated to defend any marble surface from water, oils, greases and stains of all kinds.

It is possible to use PROTECTOR MARMO both on surfaces with a rough and glossy finish, indoors and outdoors, with the certainty of not altering their appearance and natural colouring.

Does not form surface films.

In this way water and oil (and the dirt transported by them) are no longer able to penetrate inside the marble, which will maintain its typical appearance for a long time without however altering the natural transpiration of the surface. PROTECTOR MARMO also creates a barrier to the rising efflorescent saline, mold and algae, and eliminates all the chemical-physical and biological reactions that normally occur in the presence of water, offering broad protection against all damage caused by humidity..

How to use

The product is ready to use. The surface must be dry and clean (if necessary wash with our Marmoclean product). The application can be done either by brush or by pouring directly onto the surface. Wait for complete drying, which takes place in an extremely short time (max 1-2h), protecting the treated surface from rain. The surface can be walked on immediately after drying, but definitive protection is obtained 24 hours after treatment.

On glossy surfaces, if traces of the product remain after evaporation of the solvent, wipe over with a soft cloth, possibly using a small amount of product again.

Recommendations: avoid applying the product in full sun, in strong winds or in the rain. Normally the product does not cause color changes. However, if you do not know of any previous treatments, it is advisable to carry out a trial on a limited area to ensure that there are no unwanted side effects.
